

New Abstract

ABSTRACT OF THE DISCLOSURE

An article of manufacture for use in a proofing process comprises a sheet of paper that includes a blank region for subsequent printing of a content image portion, and a marginal region outside of the blank region. The marginal region includes one or more standard color bars pre-printed thereon. Each of the one or more standard color bars has a plurality of color blocks. Each color block reflects a wavelength in the electromagnetic spectrum that represents a color selected from a color space. The blank region and the marginal region constitute the entire surface area of one side of the sheet of paper.
